

Ocean – Page 1

Oceans cover more than seventy percent of the Earth's surface and are essential to life on the planet. They regulate climate, produce oxygen, and support vast biodiversity. Marine ecosystems include coral reefs, deep-sea environments, and coastal regions. Oceans provide food, transportation routes, and economic opportunities. Pollution, overfishing, and climate change pose serious threats to ocean health. Rising sea temperatures and acidification affect marine species and ecosystems. Conservation of oceans involves sustainable fishing, pollution control, and protection of marine habitats. International cooperation is necessary because oceans connect all nations. Healthy oceans are vital for environmental balance and human survival.
